

# IP*cts* Multi-Site Application

The IP PCTs when used in a multi-site application provides the facility to connect all systems together and when configured with the LCR enables a 'Single Numbering Plan' providing simple calling between locations. The IP PCTs uses 'Inter System Trunking' over an IP network so all communications between a companies locations are for free, anywhere and everywhere in the world.

An additional benefit is the ability to make a call to an outside number from one location and if a cheaper/lower cost route can be used by accessing the PSTN via another location the IP PCTs systems handle this automatically.

The Inter System Trunking facility provides multiple ports enabling multiple simultaneous calls between locations. Caller information is passed within the IST to the called parties CTI.
